

BACKEND ENGINEERING AND AI PRODUCT DEVELOPMENT

Taiwan | yili.code@gmail.com | [Portfolio](#) | [GitHub](#)

SUMMARY

Third-year computer science student building Python services that turn noisy inputs into usable Telegram workflows. Work spans asynchronous ingestion, Gemini integration, durable cloud delivery, and product changes made from real use.

PROJECT EXPERIENCE

Crypto Flash

Python · asyncio · WebSockets · RSS · Gemini · Telegram

- Built a service that filters crypto and macro sources into alerts, digests, search, event tracking, and YouTube summaries.
- Simplified message structure after frequent alerts made fixed analysis sections repetitive and harder to scan.
- Implemented keyword prefiltering, bounded asynchronous queues, persistent deduplication, and explicit failure handling around external feeds and Gemini.

InnoServe 2026

Welfare access · five-person team · AI-assisted development

- Worked with a five-person team, including a faculty advisor, to define the user problem and divide implementation by feature.
- Used AI-assisted development to build the initial user-profile flow and guidance that matched user information with potentially relevant welfare benefits.
- Integrated the feature into a functional demonstration system for the competition presentation.

Mnemosyne

Python · Pydantic · Firestore · Cloud Run · Cloud Tasks

- Generates schema-validated Traditional Chinese vocabulary cards and schedules recall-graded reviews.
- Stores production state in Firestore and uses Cloud Tasks for rate-limited, retryable review-card delivery without duplicate enqueueing.

News Agent

Python · Gemini · RSS · Telegram Bot API · GitHub Actions

- Deduplicates six AI and software feeds into one scheduled English briefing with source links.
- Reworked Chinese translations into structured English sections for event facts, technical context, founder perspective, and personal relevance.

EDUCATION

National Taiwan Ocean University · B.S. Computer Science, Year 3 · TOEIC 900

TECHNICAL SKILLS

Python, FastAPI, asyncio, REST APIs, SQLite, Firestore, Redis, Docker, GitHub Actions, Cloud Run, Cloud Tasks, Telegram Bot API, pytest, unittest, Ruff
